Forensics	Medium	400 pts	Mubarak Mikail

Challenge Description

SOS, someone is torrenting on our network.

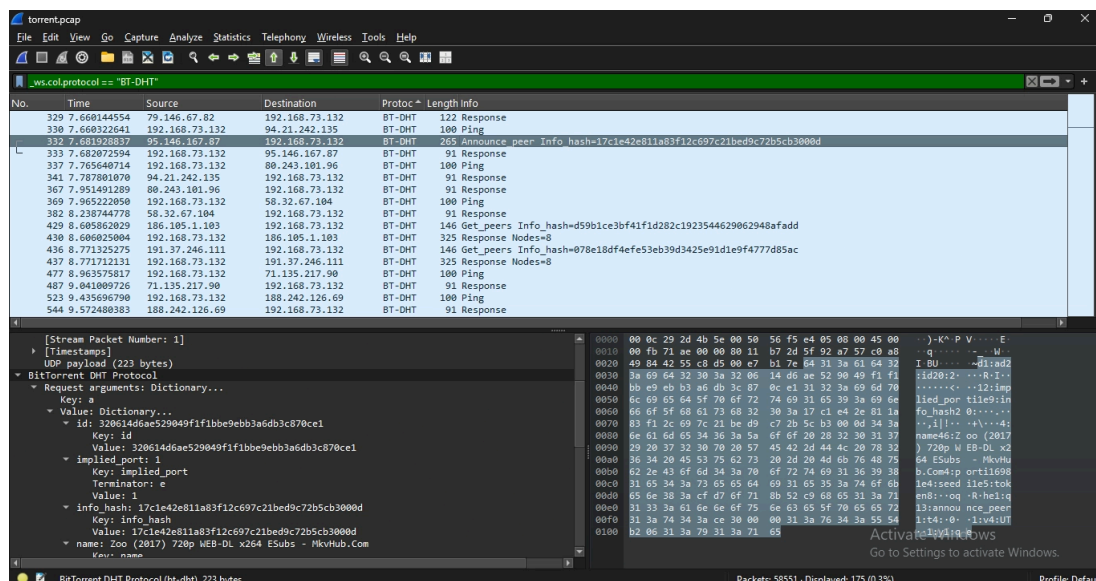

One of your colleagues has been using BitTorrent to download files on the company's network. Can you identify the file(s) that were downloaded?

The file name will be the flag in the format:

picoCTF{filename}

Provided File: torrent.pcap

Analysis

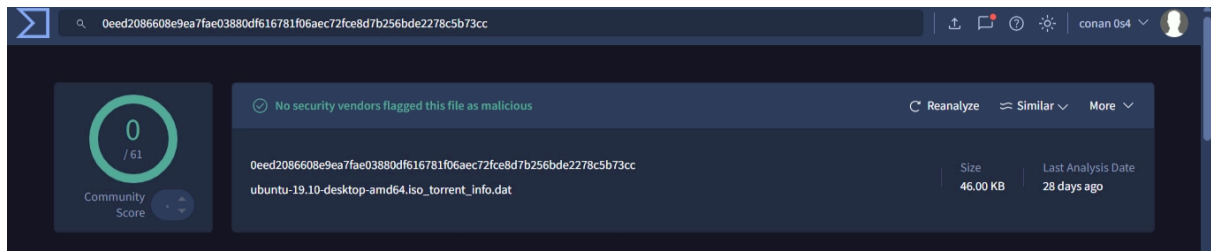

Before analyzing the packet capture, it is helpful to understand what **BitTorrent** is and how it operates on a network.

The **Info Hash** is a SHA-1 hash of the torrent's metadata. It uniquely identifies a torrent and is used by trackers and peers to locate others sharing the same file. Because each torrent has a unique Info Hash, it can often be searched online to determine which file was being distributed.

Extracting

```
tshark -r torrent.pcap -V | grep "info_hash"
```

Flag

```
picoCTF{ubuntu-19.10-desktop-amd64.iso}
```
